a storage medium including a software program that, upon execution:

upon an initial connection to a network, accesses a first portion of a file system from a server and storing said first portion in the non-volatile memory, receives a request for a second portion of a file system after said initial connection, identifies whether the second portion is stored in the non-volatile memory by associating portions of the file system used by the client during start-up with the first location;

wherein associating further comprises:

monitoring accesses to a plurality of portions of the file system during start-up;

retrieving the plurality of portions from the file system;

storing the plurality of portions in the first location;

retrieving a plurality of portions from the file system using multicasting;

storing the plurality of portions in the second location; and
